

# How Does Diet Affect Kids With ADHD?

Years ago, there was a prevailing theory that ADHD was caused by diet. Many parents subscribed to the [Feingold diet](#) or believed that most forms of [ADHD were caused by food additives](#) or the modern diet. Modern medicine, however, indicates that these dietary matters are in fact not the cause of ADHD, but that diet can impact the symptoms and presentation of ADHD. Paying attention to one's diet is crucial for a healthy lifestyle in today's 21st-century world for all kids, but especially for those diagnosed with ADHD.

Unfortunately in our busy, fast-paced households, the family diet is too often dictated by how much time we have to cook and prepare a meal rather based on considerations for what meals would be best to eat to benefit our minds and bodies. Our team at South County Child and Family Consultants strongly encourages parents to learn how diet can affect kids with ADHD.

For kids with ADHD, dietary concerns have been a long term topic of discussion. Some recent research raises questions about whether diets such as the [Mediterranean diet actually](#) can help kids with ADHD. For the most part, when we look closely at the research it suggests that diet can be helpful at minimizing the impact of ADHD symptoms but is not directly a cause of ADHD. The common observation of kids getting "wired" and overactive after eating too many sweets at a birthday party (remember them?) is probably a result of the sugar, as well as the atmosphere of other excitable kids. Some kids with ADHD are likely to be more affected by excessive

sweets, however almost all kids would benefit from their parents setting appropriate limits on sugar intake.
